

ABSTRACT

The visor protector prevents a visor secured to a helmet from being scratched when not in use, such as during transportation thereof. The protector includes a protective member comprising an external and an internal protective shell, joined together at a common protective shell edge, hence forming V-shaped cross section and a trough-like channel. When the visor protector is installed on a visor, the external shell substantially entirely overlies the visor external surface, and the internal protective shell at least partially overlies the visor internal surface. To install the visor protector on a visor, the visor is inserted in the trough-like channel, slid along the external and internal protective shells, and the visor protector is then secured to the visor using one of several attachment methods.
